Background Problem:

At present, most of the pharmacies are being organized by maintaining old traditional rules. Most of the pharmacy stake holders are dependent on pen-paper for recording, paper's file for tracking. Phone calls are the main method for contacting suppliers and customers. These types of manual activities slow down pharmacies' daily activities. When any important information needed, it's very hard to find, even sometimes, might not be found. Errors in billing, stock counting, record keeping are much familiar for these types of pharmacies. On the other hand, stakeholders expect a faster, reliable, easy-to-understand system. Traditional management cannot meet the needs of the modern digital pharmacy era.

In the present much-advanced digital era, the pharmaceutical industry should not lag behind. Pharmacy management has become quite an essential element for maintaining smooth operations and ensuring the delivery of quality health care services. Many small- and medium-sized pharmacies still rely heavily on manual systems, which quite often lead to mismanagement in their operations. Frequent errors such as stockouts, overstocking, and incorrect sales tracking reduce overall profitability. More importantly, these issues may compromise patient safety when critical or lifesaving medications are unavailable at the right time.

A pharmacy nowadays has to coordinate with several suppliers, accurately track batches, and monitor the expiration dates of drugs while being compliant with regulatory standards. These are all time-consuming activities if managed manually and prone to human error. Consequently, there is an increasing demand for a contemporary, integrated, automated system that would take care of such complicated processes.

Pharma Track - Pharmacy Stock and Sales Management System [PSSMS], a digital pharmacy management system, is designed to meet these challenges. It is an overall digital solution that equips pharmacies with effective tools for inventory management, real-time sales tracking, and expiration deadline tracking.

It will help the pharmacy to improve operational efficiency, remain compliant, and ultimately offer better healthcare services to customers and patients alike.

Key benefits of Pharma Track-PSSMS:

- Improved accuracy in inventory management
- Real-time sales tracking and data-driven insights
- Tracking upcoming expiries automatically with timely notifications
- Reduction in human errors and workflow bottlenecks
- Improved Compliance with Pharmaceutical Standards

Ultimately, Pharma Track-PSSMS will enhance the operational effectiveness of pharmacies, reduce financial losses, and ensure a constant supply of key medicines. It is high time to forget old traditional systems and rely on digital pharmacy management like PSSMS. A system like this can enhance pharmacy management in modern era.

Target Group of Users:

The Pharma Track-PSSMS summarizes information from all activities transacted within the system into useful insights. While the admin drives this reporting aspect of the use case, the information is supported by contributions provided by the four key identified user groups. This ensures that every operational action, every action related to inventory, sales, billing, and delivery, is indeed reflected in those final reports.

The reporting module becomes powerful because each of the four targeted users contributes essential data. The four targeted users of Pharma Track - Pharmacy Stock and Sales Management System [PSSMS] are:

- **Admin:** Admin is the head user here in PSSMS. He can control and check accuracy of each user. Admin will generate and review comprehensive reports, which include sales summaries, inventory status, listings for expiry, performance of suppliers, financial logs, and reports on user activities. Admin can update their details, track and sack other users.
- **Pharmacist:** Pharmacists have the second highest priority among the users of PSSMS. He will be appointed by admin. Pharmacists will provide the critical data through medicine updates, expiry monitoring, stock checks, and sales entries, which form the basis of inventory and expiry-related reports.
- **Cashier:** The main responsibility of cashier is to make up-to-date financial matters. Cashiers will provide critical data through medicine updates, expiry monitoring, stock checks, and sales entries, which form the basis of inventory and expiry-related reports. Even if some products are being imported or exported, he will be responsible for updating the financial calculation.
- **Supplier:** Suppliers know better about invoices and pricing. It will also ensure transparency. Suppliers will add delivery update information, batch numbers, invoices, and pricing information to contribute to the procurement and supply chain reports.
- **Customer:** Customers will be field-level users of PSSMS. They will be able to check prices, expiration date, availability in stock, batch numbers and other info about pharmaceutical elements. They don't need to come to pharmacy to know about these, they will be able to know from home if they use PSSMS.

These are the four targeted users of PSSMS. It ensures completeness and reliability in the reporting system by integrating the various contributions from the four users. This smooth flow of information within the system improves accuracy, enhances transparency, and supports better decision-making across the pharmacy. At the end, the Generate Reports feature strengthens operational control and accountability and helps to maintain a well-organized and compliant pharmacy management environment.
